43 years old man presented with epigastric pain and bleeding per rectum. Upper gastrointestinal endoscopy (Video1) revealed multiple sessile gastric polyposis. Histopathological examination of one polyp revealed H. pylori related inflammation . Colonoscopy (Video2)

detected ulcerations and hyperemic inflammations of the rectal and sigmoid mucosa. Histopathological examination of colonic and rectal biopsies revealed ulcerative colitis with mild activity .Finally the question is: Is there any relation between gastric and colonic lesions?
