Abstract

Totally *equistable*, *totally* Φ_0 - *equistable*, *practically* - *equistable*, *practically* Φ_0 - *equistable* of system of differential equations are studied, Cone valued perturbing Liapunov functions method and comparison methods are our technique, Some results of these properties are given.

Keywords: Totally *equistable*, *totally* Φ_0 - *equistable*, *practically* - *equistable*, *practically* Φ_0 - *equistable*- Cone valued perturbing Liapunov functions method.

1. Introduction

Consider the non linear system of ordinary differential equations

$$\mathbf{x}' = \mathbf{f}(t, \mathbf{x}), \quad \mathbf{x}(t_0) = \mathbf{x}_0 \quad (1.1)$$

and the perturbed system

$$\mathbf{x}' = \mathbf{f}(t, \mathbf{x}) + \mathbf{R}(t, \mathbf{x}), \quad \mathbf{x}(t_0) = \mathbf{x}_0. \quad (1.2)$$

Let \mathbb{R}^n be Euclidean n -dimensional real space with any convenient norm $\|\cdot\|$, and scalar product $(\cdot, \cdot) \leq \|\cdot\| \|\cdot\|$. Let for some $\rho > 0$

$$S_\rho = \{\mathbf{x} \in \mathbb{R}^n, \|\mathbf{x}\| < \rho\}.$$

where

$$\mathbf{f}, \mathbf{R} \in \mathcal{C}[J \times S_\rho, \mathbb{R}^n], J = [0, \infty) \text{ and } \mathcal{C}[J \times S_\rho, \mathbb{R}^n]$$

denotes the space of continuous mappings $J \times S_\rho$ into \mathbb{R}^n .

Consider the scalar differential equations with an initial condition

$$\mathbf{u}' = \mathbf{g}_1(t, \mathbf{u}) \quad \mathbf{u}(t_0) = \mathbf{u}_0, \quad (1.3)$$

$$\boldsymbol{\omega}' = \mathbf{g}_2(t, \boldsymbol{\omega}) \quad \boldsymbol{\omega}(t_0) = \boldsymbol{\omega}_0 \quad (1.4)$$

and the perturbing equations

$$\mathbf{u}' = \mathbf{g}_1(t, \mathbf{u}) + \boldsymbol{\varphi}_1 \quad \mathbf{u}(t_0) = \mathbf{u}_0 \quad (1.5)$$

$$\boldsymbol{\omega}' = \mathbf{g}_2(t, \boldsymbol{\omega}) + \boldsymbol{\varphi}_2 \quad \boldsymbol{\omega}(t_0) = \boldsymbol{\omega}_0 \quad (1.6)$$

where $\mathbf{g}_1, \mathbf{g}_2 \in \mathcal{C}[J \times \mathbb{R}, \mathbb{R}]$, $\boldsymbol{\varphi}_1, \boldsymbol{\varphi}_2 \in \mathcal{C}[J, \mathbb{R}]$ respectively.

The following definitions [1] will be needed in the sequel.

Definition 1.1

A proper subset K of \mathbb{R}^n is called a cone if
(i) $\lambda K \subset K, \lambda \geq 0$, (ii) $K + K \subset K$, (iii) $\bar{K} = K$, (iv) $K^0 \neq \emptyset$, (v) $K \cap (-K) = \{0\}$,
where \bar{K} and K^0 denotes the closure and interior of K respectively and ∂K denote the boundary of K .

Definition 1.2

The set $K^* = \{\Phi \in \mathbb{R}^n, (\Phi, \mathbf{x}) \geq 0, \mathbf{x} \in K\}$ is called the adjoint cone if it satisfies the properties of the definition 3.1.

$\mathbf{x} \in \partial K$ if $(\Phi, \mathbf{x}) = 0$ for some $\Phi \in K_0^*$, $K_0 = \frac{K}{\{0\}}$.

Definition 1.3

A function $g: D \rightarrow K, D \subset \mathbb{R}^n$ is called quasimonotone relative to the cone K if $\mathbf{x}, \mathbf{y} \in D, \mathbf{y} - \mathbf{x} \in \partial K$ then there exists $\Phi_0 \in K_0^*$ such that $[(\Phi_0)_0, \mathbf{y} - \mathbf{x}] = 0$ and $(\Phi_0, g(\mathbf{y}) - g(\mathbf{x})) > 0$.

Definition 1.4

A function $a(\cdot)$ is said to belong to the class \mathcal{K} if $a \in [\mathbb{R}^+, \mathbb{R}^+]$, $a(0) = 0$ and $a(r)$ is strictly monotone increasing in r .

2. Totally equistable

In this section we discuss the concept of totally equistable of the zero solution of (1.1) using perturbing Liapuniv functions method and Comparison principle method.

We define for

$V \in \mathcal{C}[J \times S_\rho, \mathbb{R}^n]$, the function $D^+V(t, \mathbf{x})$ by

$$\sup \frac{1}{h} \left[V(t+h, \mathbf{x} + h(\mathbf{f}(t, \mathbf{x}) + \mathbf{R}(t, \mathbf{x})) - V(t, \mathbf{x}) \right]$$

The following definition [2-10] will be needed in the sequel.

Definition 2.1

The zero solution of the system (1.1) is said to be T_1 - totally equistable (stable with respect to permanent perturbations), if for every $\epsilon > 0, t_0 \in J$ there exist two positive numbers $\delta_1 = \delta_1(\epsilon) > 0$ and $\delta_2 = \delta_2(\epsilon) > 0$ such that for every solution of perturbed equation (1.2), the inequality

$$\|\mathbf{x}(t, t_0, \mathbf{x}_0)\| < \epsilon \text{ for } t \geq t_0$$

holds, provided that $\|\mathbf{x}_0\| < \delta_1$ and $\|\mathbf{R}(t, \mathbf{x})\| < \delta_2$.

Definition 2.2

The zero solution of the equation (1.3) is said to be T_1 - totally equistable (stable with respect to permanent perturbations), if for every $\epsilon > 0, t_0 \in J$, there exist two positive numbers

$\delta_1^* = \delta_1^*(\epsilon) > 0$ and $\delta_2^* = \delta_2^*(\epsilon) > 0$ such that for every solution of perturbed equation (1.5).the inequality

$$u(t, t_0, u_0) < \epsilon, \quad t \geq t_0$$

holds, provided that $u_0 < \delta_1^*$ and $\varphi_1(t) < \delta_2^*$.

Theorem 2.1

Suppose that there exist two functions $g_1, g_2 \in C[J \times R, R]$ with $g_1(t, 0) = g_2(t, 0) = 0$ and there exist two Liapunov functions

$$V_1 \in C[J \times S_\rho, R^n] \text{ and } V_{2\eta} \in C[J \times S_\rho \cap S_\eta^c, R^n]$$

with $V_1(t, 0) = V_{2\eta}(t, 0) = 0$ where

$S_\eta = \{x \in R^n, \|x\| < \eta\}$ for $\eta > 0$ and S_η^c denotes the complement of S_η satisfying the following conditions:

(H₁) $V_1(t, x)$ is locally Lipschitzian in x .

$$D^+V_1(t, x) \leq g_1(t, V_1(t, x)) \quad \forall (t, x) \in J \times S_\rho$$

(H₂) $V_{2\eta}(t, x)$ is locally Lipschitzian in x

$$b(\|x\|) \leq V_{2\eta}(t, x) \leq a(\|x\|) \quad \forall (t, x) \in J \times S_\rho \cap S_\eta^c$$

where $a, b \in \mathcal{K}$ are increasing functions.

(H₃)

$$D^+V_1(t, x) + D^+V_{2\eta}(t, x) \leq g_2(t, V_1(t, x) + V_{2\eta}(t, x)) \quad \forall (t, x) \in J \times S_\rho \cap S_\eta^c$$

(H₄) If the zero solution of (1.3) is equistable, and the zero solution of (1.4) is totally equistable

Then the zero solution of (1.1) is totally equistable.

Proof

Since the zero solution of the system (1.4) is totally equistable, given $b(\epsilon) > 0$, there exist two positive numbers

$\delta_1^* = \delta_1^*(\epsilon) > 0$ and $\delta_2^* = \delta_2^*(\epsilon) > 0$ such that for every solution $\omega(t, t_0, \omega_0)$ of perturbed equation (1.6) the inequality

$$\omega(t, t_0, \omega_0) < \epsilon, \quad t \geq t_0 \tag{2.1}$$

holds, provided that $\omega_0 < \delta_1^*$ and $\varphi_2(t) < \delta_2^*$.

Since the zero solution of (1.3) is equistable given $\frac{\delta_0(\epsilon)}{2}$ and $t_0 \in J$, there exists $\delta = \delta(t_0, \epsilon) > 0$ such that

$$u(t, t_0, u_0) < \frac{\delta_0(\epsilon)}{2} \tag{2.2}$$

holds, provided that $u_0 \leq \delta$

From the condition (H₂) we can find $\delta_1 = \delta_1(\epsilon) > 0$ such that

$$a(\delta_1) + \frac{\delta_0}{2} < \delta_1^* \tag{2.3}$$

To show that the zero solution of (1.1) is T_1 - totally equistable, it must show that for every $\epsilon > 0, t_0 \in J$ there exist two positive numbers $\delta_1 = \delta_1(\epsilon) > 0$ and $\delta_2 = \delta_2(\epsilon) > 0$ such that for every solution $x(t, t_0, x_0)$ of perturbed equation (1.2).the inequality

$$\|x(t, t_0, x_0)\| < \epsilon \text{ for } t \geq t_0$$

holds, provided that $\|x_0\| < \delta_1$ and $\|R(t, x)\| < \delta_2$.

Suppose that this is false, then there exists a solution $x(t, t_0, x_0)$ of (1.2) with $t_1 > t_0$ such that

$$\|x(t_0, t_0, x_0)\| = \delta_1, \quad \|x(t_1, t_0, x_0)\| = \epsilon \tag{2.4}$$

(2.4)

$$\delta_1 \leq \|x(t, t_0, x_0)\| \leq \epsilon \text{ for } t \in [t_0, t_1].$$

Let $\delta_1 = \eta$ and setting $m(t, x) = V_1(t, x) + V_{2\eta}(t, x)$

Since $V_1(t, x)$ and $V_{2\eta}(t, x)$ are Lipschitzian in x for constants M_1 and M_2 respectively.

Then

$$D^+V_1(t, x) + D^+V_{2\eta}(t, x) \leq D^+V_1(t, x) + D^+V_{2\eta}(t, x) + M\|R(t, x)\|$$

where $M = M_1 + M_2$ From the condition (H₃) we obtain the differential inequality

$$D^+V_1(t, x) + D^+V_{2\eta}(t, x) \leq g_2(t, V_1(t, x) + V_{2\eta}(t, x)) + M\|R(t, x)\|$$

for $t \in [t_0, t_1]$ Then we have

$$D^+m(t, x) \leq g_2(t, m(t, x)) + M\|R(t, x)\|$$

Let $\omega_0 = m(t_0, x_0) = V_1(t_0, x_0) + V_{2\eta}(t_0, x_0)$

Applying the comparison Theorem (1.4.1) of [7], it yields

$$m(t, x) \leq r_2(t, t_0, \omega_0) \text{ for } t \in [t_0, t_1].$$

where $r_2(t, t_0, \omega_0)$ is the maximal solution of the perturbed equation (1.6)

$$\text{Define } \varphi_2(t) = M\|R(t, x)\|$$

To prove that

$$r_2(t, t_0, \omega_0) < b(\epsilon).$$

It must be show that

$$\omega_0 < \delta_1^* \text{ and } \varphi_2(t) < \delta_2^* .$$

Choose $u_0 = V_1(t_0, x_0)$. From the condition (H₁) and applying the comparison Theorem of [7], it yields

$$V_1(t, x) \leq r_1(t, t_0, u_0)$$

where $r_1(t, t_0, u_0)$ is the maximal solution of (1.3).

From (2.2) at $t = t_0$

$$V_1(t_0, x_0) \leq r_1(t_0, t_0, u_0) < \frac{\delta_0(\epsilon)}{2} \tag{2.5}$$

From the condition (H₂) and (2.4), at $t = t_0$

$$V_{2\eta}(t_0, x_0) \leq a(\|x_0\|) \leq a(\delta_1) \tag{2.6}$$

From (2.3), we get

$$\omega_0 = V_1(t_0, x_0) + V_{2\eta}(t_0, x_0) \leq \frac{\delta_0(\epsilon)}{2} + a(\delta_1) < \delta_1^* .$$

Since $\varphi_2(t) = M\|R(t, x)\| \leq M\delta_2 = \delta_2^*$

From (2.1), we get

$$m(t, x) \leq r_2(t, t_0, \omega_0) < b(\epsilon) \tag{2.7}$$

Then from the condition (H₂), (2.4) and (2.7) we get $t = t_1$

$$b(\epsilon) = b(\|x(t_1)\|) \leq V_{2\eta}(t_1, x(t_1)) < m(t_1, x(t_1)) \leq r_2(t_1, t_0, \omega_0) < b(\epsilon).$$

This is a contradiction, then it must be $\|x(t, t_0, x_0)\| < \epsilon$ for $t \geq t_0$

holds, provided that $\|x_0\| < \delta_1$ and $\|R(t, x)\| < \delta_2$.

Therefore the zero solution of (1.1) is totally equistable.

3. Totally Φ_0 - equistable.

In this section we discuss the concept of Totally Φ_0 - equistable of the zero solution of (1.1) using cone valued perturbing Liapunov functions method and Comparison principle method.

The following definition [3] will be needed in the sequel.

Definition 3.1

The zero solution of the system (1.1) is said to be totally Φ_0 - equistable (Φ_0 - equistable with respect to permanent perturbations), if for every $\epsilon > 0$,

$t_0 \in J$ and $\phi_0 \in K_0^*$ there exist two positive numbers $\delta_1 = \delta_1(\epsilon) > 0$ and $\delta_2 = \delta_2(\epsilon) > 0$ such that the inequality

$$(\Phi_0, x(t, t_0, x_0)) < \epsilon \text{ for } t \geq t_0$$

holds, provided that $(\Phi_0, x_0) < \delta_1$ and $\|R(t, x)\| < \delta_2$ where $x(t, t_0, x_0)$ is the maximal solution of perturbed equation (1.2).

Let for some $\rho > 0$

$$S_\rho^* = \{x \in R^n, (\Phi_0, x) < \rho, \phi_0 \in K_0^*\}$$

Theorem 3.1

Suppose that there exist two functions $g_1, g_2 \in C[J \times R, R]$ with $g_1(t, 0) = g_2(t, 0) = 0$ and let there exist two cone valued Liapunov functions

$$V_1 \in C[J \times S_\rho^*, K] \text{ and } V_{2\eta} \in C[J \times S_\rho^* \cap S_\eta^{*c}, K] \\ V_1(t, 0) = V_{2\eta}(t, 0) = 0$$

with

$$S_\eta^* = \{x \in K, (\Phi_0, x) < \eta, \phi_0 \in K_0^*\} \text{ for } \eta > 0 \text{ and } S_\eta^{*c}$$

denotes the complement of S_η^* satisfying the following conditions:

$$(h_1) \quad V_1(t, x) \text{ is locally Lipschitzian in } x \text{ and } D^+[(\Phi_0, V_1)(t, x)] \leq g_1(t, V_1(t, x)) \text{ for } (t, x) \in J \times S_\rho^*.$$

$$(h_2) \quad V_{2\eta}(t, x) \text{ is locally Lipschitzian in } x \text{ and } b(\phi_0, x) \leq [(\Phi_0, V_{2\eta})(t, x)] \leq a(\phi_0, x) \text{ for } (t, x) \in J \times S_\rho^* \cap S_\eta^{*c}.$$

where $a, b \in \mathcal{K}$ are increasing functions.

$$(h_3) \quad D^+[(\Phi_0, V_1)(t, x)] + D^+[(\Phi_0, V_{2\eta})(t, x)] \leq g_2(t, V_1(t, x) + V_{2\eta}(t, x)) \\ \text{for } (t, x) \in J \times S_\rho^* \cap S_\eta^{*c}.$$

(h₄) If the zero solution of (1.3) is Φ_0 - equistable, and the zero solution of (1.4) is totally Φ_0 - equistable, then the zero solution of (1.1) is totally Φ_0 - equistable.

Proof

Since the zero solution of (1.4) is totally Φ_0 - equistable, given $b(\epsilon) > 0$ there exist two positive numbers $\delta_1^* = \delta_1^*(\epsilon) > 0$ and $\delta_2^* = \delta_2^*(\epsilon) > 0$ such that the inequality

$$(\Phi_0, r_2(t, t_0, \omega_0)) < \epsilon, \quad t \geq t_0 \tag{3.1}$$

holds, provided that $(\Phi_0, \omega_0) < \delta_1^*$ and $\varphi_2(t) < \delta_2^*$ where $r_2(t, t_0, \omega_0)$ is the maximal solution of perturbed equation (1.6).

Since the zero solution of the system (1.3) is

Φ_0 - equistable, given $\frac{\delta_0(\epsilon)}{2}$ and $t_0 \in J$ there exists $\delta = \delta(t_0, \epsilon) > 0$ such that

$$(\Phi_0, r_1(t, t_0, u_0)) < \frac{\delta_0(\epsilon)}{2} \tag{3.2}$$

holds, provided that $[(\Phi_0, u_0)] \leq \delta$ where $r_1(t, t_0, u_0)$ is the maximal solution of (1.3)

From the condition (h₂) we can choose $\delta_1 = \delta_1(\epsilon) > 0$ such that

$$a(\delta_1) + \frac{\delta_0}{2} < \delta_1^* \tag{3.3}$$

To show that the zero solution of (1.1) is T_1 - totally Φ_0 - equistable, it must be proved that for every $\epsilon > 0, t_0 \in J$ and $\phi_0 \in K_0^*$ there exist two positive numbers $\delta_1 = \delta_1(\epsilon) > 0$

and $\delta_2 = \delta_2(\epsilon) > 0$ such that the inequality $(\Phi_0, x(t, t_0, x_0)) < \epsilon$ for $t \geq t_0$

holds, provided that $(\Phi_0, x_0) < \delta_1$ and $\|R(t, x)\| < \delta_2$ where $x(t, t_0, x_0)$ is the maximal solution of perturbed equation (1.2).

Suppose that is false, then there exists a solution $x(t, t_0, x_0)$ of (1.2) with $t_1 > t_0$ such that $(\Phi_0, x(t_0, t_0, x_0)) = \delta_1, (\Phi_0, x(t_1, t_0, x_0)) = \epsilon$ (3.4)

$$\delta_1 \leq (\Phi_0, x(t, t_0, x_0)) \leq \epsilon \text{ for } t \in [t_0, t_1].$$

Let $\delta_1 = \eta$ and setting $m(t, x) = V_1(t, x) + V_{2\eta}(t, x)$

Since $V_1(t, x)$ and $V_{2\eta}(t, x)$ are Lipschitzian in x for constants M_1 and M_2 respectively.

$$\text{Then} \\ D^+(\Phi_0, V_1(t, x))_1 \cdot 2 + D^+[(\Phi_0, V_{2\eta})(t, x)]_1 \cdot 2 \\ \leq D^+[(\Phi_0, V_1)(t, x)]_1 \cdot 1 + D^+(\Phi_0, V_{2\eta}(t, x))_1 \cdot 1 + M\|R(t, x)\|$$

where $M = M_1 + M_2$ From the condition

(h₃) we obtain the differential inequality

$$D^+[(\phi_0, V_1)(t, x)] + D^+(\phi_0, V_{2\eta})(t, x) \leq g_2(t, V_1(t, x) + V_{2\eta}(t, x)) + M\|R(t, x)\|$$

for $t \in [t_0, t_1]$ Then we have

$$D^+(\phi_0, m(t, x)) \leq g_2(t, m(t, x)) + M\|R(t, x)\|$$

$$\text{Let } \omega_0 = m(t_0, x_0) = V_1(t_0, x_0) + V_{2\eta}(t_0, x_0)$$

Applying the comparison Theorem of [7], yields $(\phi_0, m(t, x)) \leq (\phi_0, r_2(t, t_0, \omega_0))$ for $t \in [t_0, t_1]$.

Define $\varphi_2(t) = M\|R(t, x)\|$

To prove that

$$[(\phi_0, r_2)(t, t_0, \omega_0)] < b(\epsilon).$$

It must be shown that

$$[(\phi_0, \omega)_0] < \delta_1^* \text{ and } \varphi_2(t) < \delta_2^*.$$

Choose $u_0 = V_1(t_0, x_0)$. From the condition

(h₁) and applying the comparison Theorem

[7], it yields

$$[(\phi_0, V_1)(t, x)] \leq [(\phi_0, r_1)(t, t_0, u_0)]$$

From (3.2) at $t = t_0$

$$(\phi_0, V_1(t_0, x_0)) \leq [(\phi_0, r_1)(t_0, t_0, u_0)] < \frac{\delta_0(\epsilon)}{2} \tag{3.5}$$

From the condition (h₂) and (3.4), at $t = t_0$

$$(\phi_0, V_{2\eta}(t_0, x_0)) \leq a(\phi_0, x_0) \leq a(\delta_1) \tag{3.6}$$

From (3.3), we get

$$[(\phi_0, \omega)_0] = (\phi_0, V_1(t_0, x_0)) + (\phi_0, V_{2\eta}(t_0, x_0)) \leq \frac{\delta_0(\epsilon)}{2} + a(\delta_1) < \delta_1^*.$$

Since $\varphi_2(t) = M\|R(t, x)\| \leq M\delta_2 = \delta_2^*$

From (3.1), we get

$$(\phi_0, m(t, x)) \leq (\phi_0, r_2(t, t_0, \omega_0)) < b(\epsilon) \tag{3.7}$$

Then from the condition (h₂), (3.4) and (3.7) we get at $t = t_1$

$$b(\epsilon) = b(\phi_0, x(t_1))$$

$$\leq (\phi_0, V_{2\eta}(t_1, x(t_1))) < (\phi_0, m(t_1, x(t_1))) \leq [(\phi_0, r_2)(t_1, t_0, \omega_0)] < b(\epsilon).$$

This is a contradiction, then

$$(\phi_0, x(t, t_0, x_0)) < \epsilon \text{ for } t \geq t_0$$

provided that $(\phi_0, x_0) < \delta_1$ and $\|R(t, x)\| < \delta_2$ where $x(t, t_0, x_0)$ is the maximal solution of perturbed equation (1.2).

Therefore the zero solution of (1.1) is totally ϕ_0 -equistable.

4. Practically equistable

In this section, we discuss the concept of practically equistable of the zero solution of (1.1) using perturbing Liapunov functions method and Comparison principle method.

The following definition [5] will be needed in the sequel.

Definition 4.1

Let $0 < \lambda < A$ be given. The system (1.1) is said to be practically equistable if for $t_0 \in J$ such that the inequality

$$\|x(t, t_0, x_0)\| < A \text{ for } t \geq t_0 \tag{4.1}$$

holds, provided that $\|x_0\| < \lambda$ where $x(t, t_0, x_0)$ is any solution of (1.1).

In case of uniformly practically equistable, the inequality (4.1) holds for any t_0 .

We define

$$S(A) = \{x \in R^n : \|x\| \leq A, A > 0\}.$$

Theorem 4.1

Suppose that there exist two functions $g_1, g_2 \in C[J \times R, R]$ with $g_1(t, 0) = g_2(t, 0) = 0$ and there exist two Liapunov functions $V_1 \in C[J \times S(A), R^n]$ and $V_{2\eta} \in C[J \times S(A) \cap S(B)^c, R^n]$ with

$$V_1(t, 0) = V_{2B}(t, 0) = 0$$

where

$S(B) = \{x \in R^n, \|x\| < B, 0 < B < A\}$ and $S(B)^c$ denotes the complement of $S(B)$ satisfying the following conditions:

(I) $V_1(t, x)$ is locally Lipschitzian in x .

$$D^+V_1(t, x) \leq g_1(t, V_1(t, x)) \quad \forall (t, x) \in J \times S(A).$$

(II) $V_{2B}(t, x)$ is locally Lipschitzian in x .

$$b(\|x\|) \leq V_{2B}(t, x) \leq a(\|x\|) \quad \forall (t, x) \in J \times S(A) \cap S(B)^c.$$

where $a, b \in \mathcal{K}$ are increasing functions.

(III)

$$D^+V_1(t, x) + D^+V_{2\eta}(t, x) \leq g_2(t, V_1(t, x) + V_{2B}(t, x)) \quad \forall (t, x) \in J \times S(A) \cap S(B)^c.$$

(IV) If the zero solution of (1.3) is equistable, and the zero solution of (1.4) is uniformly practically equistable.

Then the zero solution of (1.1) is practically equistable.

Proof

Since the zero solution of (1.4) is uniformly practically equistable, given $0 < \lambda_0 < A$ such that for every solution $\omega(t, t_0, \omega_0)$ of (1.4) the inequality

$$\omega(t, t_0, \omega_0) < b(A) \tag{4.2}$$

holds provided $\omega_0 \leq \lambda_0$.

Since the zero solution of the system (1.3) is

equistable, given $\frac{\lambda_0}{2}$ and $t_0 \in R_+$ there exist $\delta = \delta(t_0, \epsilon) > 0$ such that for every solution $u(t, t_0, u_0)$ of (1.3)

$$u(t, t_0, u_0) < \frac{\lambda_0}{2} \tag{4.3}$$

holds provided that $u_0 \leq \delta$.

From the condition (II) we can find $\lambda > 0$ such that

$$a(\lambda) + \frac{\lambda_0}{2} \leq \lambda_0 \tag{4.4}$$

To show that The zero solution of (1.1) practically equistable , it must be exist $0 < \lambda < A$ such that for for any solution $x(t, t_0, x_0)$ of (1.1) the inequality

$$\|x(t, t_0, x_0)\| < A \quad \text{for } t \geq t_0$$

holds ,provided that $\|x_0\| < \lambda$.

Suppose that this is false, then there exists a solution $x(t, t_0, x_0)$ of (1.1) with $t_1 > t_0$ such that

$$\|x(t_0, t_0, x_0)\| = \lambda, \quad \|x(t_1, t_0, x_0)\| = A \tag{4.5}$$

$$\lambda \leq \|x(t, t_0, x_0)\| \leq A \quad \text{for } t \in [t_0, t_1].$$

Let $\lambda = B$ and setting

$$m(t, x) = V_1(t, x) + V_{2\eta}(t, x)$$

From the condition (III) we obtain the differential inequality for $t \in [t_0, t_1]$

$$D^+m(t, x) \leq g_2(t, m(t, x))$$

$$\text{Let } \omega_0 = m(t_0, x_0) = V_1(t_0, x_0) + V_{2B}(t_0, x_0)$$

Applying the comparison Theorem [7] , yields $m(t, x) \leq r_2(t, t_0, \omega_0)$ for $t \in [t_0, t_1]$.

where $r_2(t, t_0, \omega_0)$ is the maximal solution of (1.4)

To prove that

$$r_2(t, t_0, \omega_0) < b(A).$$

It must be show that $\omega_0 \leq \lambda_0$.

Choose $u_0 = V_1(t_0, x_0)$, from the condition (II) and applying the comparison Theorem of [7], yields

$$V_1(t, x) \leq r_1(t, t_0, u_0)$$

where $r_1(t, t_0, u_0)$ is the maximal solution of (1.3).

From (4.3) at $t = t_0$

$$V_1(t, x) \leq r_1(t, t_0, u_0) < \frac{\lambda_0}{2}$$

From the condition (II) and (4.5) , at $t = t_0$

$$V_{2B}(t_0, x_0) \leq a(\|x(t_0)\|) \leq a(\lambda)$$

From (4.4),(4.6) and(4.7), we get

$$\omega_0 = V_1(t_0, x_0) + V_{2B}(t_0, x_0) \leq \lambda_0$$

From (4.2) ,we get

$$m(t, x) \leq r_2(t, t_0, \omega_0) < b(A)$$

Then from the condition(II) , (4.5) and (4.8), we get at $t = t_1$

$$b(A) = b(\|x(t_1)\|) \leq V_{2B}(t_1, x_1) < m(t_1, x(t_1)) \leq r_2(t_1, t_0, \omega_0) < b(A).$$

This is a contradiction ,then

$$\|x(t, t_0, x_0)\| < A \quad \text{for } t \geq t_0$$

provided that $\|x_0\| < \lambda$.

Therefore the zero solution of (1.1) is practically equistable.

5. practically ϕ_0 - equistable

In this section we discuss the concept of practically ϕ_0 - equistable of the zero solution of (1.1) using cone valued perturbing Liapunov functions method and Comparison principle method.

The following definitions [6] will be needed in the sequel .

Definition 5.1

Let $0 < \lambda < A$ be given . The system (1.1) is said to be practically ϕ_0 - equistable, if for $t_0 \in J$ and $\phi_0 \in K_0^*$ such that the inequality

$$(\phi_0, x(t, t_0, x_0)) < A \quad \text{for } t \geq t_0 \tag{5.1}$$

holds ,provided that $(\phi_0, x_0) < \lambda$

where

$x(t, t_0, x_0)$ is the maximal solution of (1.1)

In case of uniformly practically ϕ_0 - equistable ,the inequality (5.1) holds for any t_0 .

We define

$$S^*(A) = \{x \in K, (\phi_0, x) < A, \phi_0 \in K_0^*\}$$

Theorem 5.1

Suppose that there exist two functions

$g_1, g_2 \in C[J \times R, R]$ with

$g_1(t, 0) = g_2(t, 0) = 0$ and let there exist two cone valued Liapunov functions

$V_1 \in C[J \times S^*(A), K]$ and $V_{2B} \in C[J \times S^*(A) \cap S^*(B)^c, K]$ with

$V_1(t, 0) = V_{2B}(t, 0) = 0$ where

$S^*(B) = \{x \in K, (\phi_0, x_0) < B, 0 < B < A, \phi_0 \in K_0^*\}$ and $S^*(B)^c$ denotes the complement of $S^*(B)$

satisfying the following conditions:

(i) $V_1(t, x)$ is locally Lipschitzian in x relative to K .

$$D^+(\phi_0, V_1(t, x)) \leq g_1(t, V_1(t, x)) \quad \forall (t, x) \in J \times S^*(A).$$

(ii) $V_{2B}(t, x)$ is locally Lipschitzian in x relative to K .

$b(\phi_0, x) \leq (\phi_0, V_{2B}(t, x)) \leq a(\phi_0, x) \quad \forall (t, x) \in J \times S^*(A) \cap S^*(B)^c$, where $a, b \in \mathcal{K}$ are increasing functions.

$$(iii) \tag{4.6}$$

$$D^+(\phi_0, V_1(t, x)) + D^+(\phi_0, V_{2B}(t, x)) \leq g_2(t, V_1(t, x) + V_{2B}(t, x)) \tag{4.7}$$

$$\forall (t, x) \in J \times S^*(A) \cap S^*(B)^c.$$

(iv) If the zero solution of (1.3) is ϕ_0 - equistable, and the zero solution of (1.4) is uniformly practically ϕ_0 equistable.

Then the zero solution of (1.1) is practically ϕ_0 - equistable.

Proof

Since the zero solution of the system (1.4) is uniformly practically ϕ_0 - equistable, given given $0 < \lambda_0 < a(B)$ for $a(B) > 0$ such that the inequality

$$(\phi_0, r_2(t, t_0, \omega_0)) < a(B) \tag{5.2}$$

holds provided $[(\phi_0, \omega)]_0 \leq \lambda_0$.where $r_2(t, t_0, \omega_0)$ is the maximal solution of (1.4).

Since the zero solution of the system (1.3) is

ϕ_0 - equistable , given $\frac{\lambda_0}{2}$ and $t_0 \in R_+$

there exist $\delta = \delta(t_0, \lambda_0)$ such that the inequality

$$(\phi_0, r_1(t, t_0, u_0)) < \frac{\lambda_0}{2} \tag{5.3}$$

From the condition (ii), assume that $a(B) \leq b(A)$ (5.4)

also we can choose $\lambda_1 > 0$ such that $a(\lambda) + \frac{\lambda_0}{2} \leq \lambda_0$ (5.5)

To show that the zero solution of (1.1) is practically ϕ_0 -equistable. It must be show that for $0 < \lambda < A$, $t_0 \in J$ and $\phi_0 \in K_0^*$ such that the inequality

$(\phi_0, x(t, t_0, x_0)) < A$ for $t \geq t_0$ holds, provided that $(\phi_0, x_0) < \lambda$ where $x(t, t_0, x_0)$ is the maximal solution of (1.1).

Suppose that is false, then there exists a solution $x(t, t_0, x_0)$ of (1.1) with $t_2 > t_1 > t_0$ such that for $(\phi_0, x_0) < \lambda$ where $\lambda = \min(\lambda_0, \lambda_1)$ $(\phi_0, x(t_1, t_0, x_0)) = \lambda_1$, $(\phi_0, x(t_2, t_0, x_0)) = A$ (5.6)

$\lambda_1 \leq (\phi_0, x(t, t_0, x_0)) \leq A$ for $t \in [t_1, t_2]$

Let $\lambda_1 = B$ and setting $m(t, x) = V_1(t, x) + V_{2B}(t, x)$

From the condition (iii) we obtain the differential inequality $D^+ + (\phi_0, m(t, x)) \leq (\phi_0, g_2(t, m(t, x)))$ for $t \in [t_1, t_2]$

$\omega_0 = m(t_1, x(t_1)) = V_1(t_1, x(t_1)) + V_{2B}(t_1, x(t_1))$

Applying the comparison Theorem of [7], yields

$$[(\phi_0)_0, m(t, x)] \leq (\phi_0, r_2(t, t_0, \omega_0))$$

To prove that

$$(\phi_0, r_2(t, t_0, \omega_0)) < a(B)$$

It must be show that

$$[(\phi_0, \omega)_0] \leq \lambda_0$$

Choose $u_0 = V_1(t_0, x_0)$ From the condition (i) and applying the comparison Theorem [7] it yields

$$(\phi_0, V_1(t, x)) \leq (\phi_0, r_1(t, t_0, u_0))$$

From (5.3) at $t = t_1$

$$(\phi_0, V_1(t, x)) \leq (\phi_0, r_1(t, t_0, u_0)) < \frac{\lambda_0}{2} \quad (5.8)$$

From the condition (ii) and (5.6), at $t = t_1$ $(\phi_0, V_{2B}(t_1, x(t_1))) \leq (\phi_0, x(t_1)) \leq a(\lambda_1)$ (5.9)

From (5.5), (5.8) and (5.9), we get

$$(\phi_0, V_{2B}(t_1, x(t_1))) \leq \lambda_0$$

From (5.2), we get

$$[(\phi_0)_0, m(t, x)] \leq (\phi_0, r_2(t, t_0, \omega_0)) < a(B) \quad (5.10)$$

Then from the condition (ii), (5.4), (5.6) and (5.10), we get at $t = t_2$

$$\begin{aligned} b(A) &= b(\phi_0, x(t_2)) \\ &\leq (\phi_0, m(t_2, x(t_2))) \\ &< (\phi_0, r_2(t_2, t_0, \omega_0)) \\ &< a(B) \\ &\leq a(A). \end{aligned}$$

which leads to a contradiction, then it must be

$$(\phi_0, x(t, t_0, x_0)) < A \quad \text{for } t \geq t_0$$

holds, provided that $(\phi_0, x_0) < \lambda$. Therefore the zero solution of (1.1) is practically ϕ_0 -equistable.
