## Letter from the Editor:

---

*Dear esteemed colleagues,*

Warm greetings

We welcome your comments as well as the scientific activity to be incorporated in the upcoming issues. Very important subjects are included in this issue: Planned placement of cervical cerclage in is mainly either history-indicated and/or prophylactic, especially in multifetal gestations. It appears to be effective in reducing the incidence of mid trimester miscarriage and preterm birth in high-risk cases.

MCA-PI evaluation prior to induction of labor (IOL) is a useful tool in prediction of IOL outcome. Lower PI values may predict successful outcome. CL assessment and EFW are other factors that may predict the outcome of IOL

It was found that COVID-19 has no effect on ovarian reserve.

A study compared intelligence level between breastfed and non-breastfed children, concluded that there was significant relation between high Wechsler Intelligence Scale score and breastfed.

The surgical outcome and intraoperative FIGO grading are strongly correlated with the presence of placental lacunae, loss of clear zone and myometrial thinning and moderately correlated with Placental bulge

A positive oral glucose challenge test only without gestational diabetes is a risk factor for perinatal morbidity like LGA and NICU admission, so early screening for GDM is advisable.

Best regards.
