Editorial:

Journal of Measurement Science and Applications (JMSA) was launched in 2020 with the aim to be the regional first scientific journal that deals with one of rare specialties; the measurement science. It is a peer-reviewed multi-disciplinary international journal established according to the National Institute of Standards (NIS) president decree No 201-2020 and will be issued periodically (twice a year) by NIS, Egypt. JMSA is devoted to publish a profound and comprehensive work in addition to foster the dissemination of scientific metrological information by publishing manuscripts in metrology including physical science, material chemistry and engineering. The journal publishes the following article types: original research papers, review articles, technical notes ,scientific reports, and letters to the editor. Accepted articles will be available online. The editorial board usually invites prominent experts to write themed reviews or featured articles and organize special issues on hot research topics in the field. Our aim is to encourage scientists worldwide to publish their theoretical and experimental findings in both the theoretical and practical applications of measurement science and its applications in physics, chemistry and engineering from inception to commercial manipulation, particularly those dealing with the seven base units of International System of units (SI) and their derivatives. JMSA covers all aspects of metrology including, but not limited to, methodology, instrumentation, and theory of assessment, evaluation, testing, characterization and measurements. On the other hand, our experienced editorial board and reviewers bring a wealth of knowledge to the author's submission via rigorous peer review process to ensure high standard publishing. Besides, fast publication process at which the first decision is provided to the authors in approximately 4-6 weeks. Hope this journal can add a value to the scientific community of metrology.
